

Senior Care Platform — Project Overview

Product-facing guide: what this admin panel is for, who uses it, and which features it includes.

PDF copy: [PROJECT OVERVIEW.pdf](#).

For technical structure (folders, store, routes, extension tips), see [ARCHITECTURE.md](#).

What it is

Senior Care Admin is a **Super Admin-only** multi-tenant operations console for a senior-care platform. The platform operator onboards care organizations (tenants), grants module permissions, and inspects each organization's data — without a separate tenant login in this build.

This build is a **front-end demo**: authentication and domain data are stored locally (seed + browser `localStorage`). There is no live care API wired in.

Who uses it

Role	Who	Purpose
Super Admin	Platform operator	Sign in to the panel; onboard / approve / offboard tenants; set feature permissions; inspect org data read-only

Tenant Owner accounts are not allowed to sign in. Owner records may still be created during onboarding (for the Owners directory), but they cannot access this admin panel.

Vaishnavi Medicare, CarePlus Homes, and similar names in the seed are **example tenants**, not the product brand.

Why it exists

Senior-care businesses often need:

- A **platform layer** to bring clinics / home-care firms onto the product
- Clear **lifecycle** for pending → active → offboarded organizations
- **Selective modules** (e.g. attendance or staff payouts) configured per tenant by the platform operator

This panel models that Super Admin workflow end-to-end in the browser.

Tenant lifecycle

```
Onboard (Super Admin)
  ↓
Lobby · pending
  ↓ Approve
Tenants · active → Super Admin can inspect + set permissions
  ↓ Offboard / reject
Offboarded
```

Onboarding can capture org basics (name, type, domain, code, logo, address, city, phone), optional Ops Admin contact, vendor-related settings, and employee offboarding / sign-in preferences.

Features (Super Admin)

Area	What you can do
Dashboard	Platform snapshot and shortcuts
Lobby	Create tenants; approve or reject pending orgs
Tenants	List active orgs; open read-only inspection; offboard
Offboarded	See removed orgs; restore when needed
Insights	Cross-tenant analytics and read-only bookings / patients / employees
Owners	Directory of tenant owner / ops admin contacts (no login)
Permissions	Turn modules on/off per tenant (which features that org is entitled to)
Settings	Demo environment controls (e.g. reset local demo data)
Tenant detail	Read-only tabs for that org’s catalog and ops data

Super Admin **cannot** create, edit, or delete tenant catalog/ops records — inspection only.

Permissions (feature access)

Super Admin uses **Permissions** to choose which modules each tenant is entitled to.

- **Core** features default **on** for new tenants (catalog, ops, analytics).
- **Add-ons** (Attendance, Staff payouts) default **off** until enabled.

This records product entitlements for each organization even though tenants do not log into this panel.

Module catalog (tenant entitlements)

Group	Modules
Core / org	Analytics
Catalog	Services, Venues, Packages
Operations	Bookings, Patients, Employees, Vendors, Vendor payments
Add-ons	Attendance, Staff payouts

Product UX principles

- Dense **ops admin** UI: tables, toolbars, modals
- Dark sidebar + light content shell
- **Sky + slate** visual system

- Clear loading, empty, error, and success states
- Destructive actions go through confirm dialogs

Stack (summary)

Layer	Choice
UI	React 19, Vite, Tailwind 4
Routing	react-router-dom (Super Admin guards)
Icons	react-icons/fi
Data	Dummy seed + platformStore → localStorage

How to run

```
npm install
npm run dev
```

Other scripts: `npm run build` · `npm run preview` · `npm run lint`
